Halbert Honey	.28		

The first part of the paper is devoted to a discussion of the
 various methods which have been proposed for the determination of
 the rate of reaction between a radical and a molecule. The most
 common of these is the method of initial rates, in which the
 initial concentration of the radical is varied and the initial
 rate of reaction is measured. This method is simple and direct,
 but it is subject to a number of errors, particularly those
 arising from the determination of the initial concentration of
 the radical. A more accurate method is the method of
 continuous variation, in which the concentration of the radical
 is varied and the rate of reaction is measured at a constant
 concentration of the molecule. This method is more complicated,
 but it is more accurate than the method of initial rates.
 The second part of the paper is devoted to a discussion of the
 various factors which influence the rate of reaction between a
 radical and a molecule. These factors include the nature of the
 radical, the nature of the molecule, the temperature, and the
 concentration of the reactants. The rate of reaction is
 generally found to increase with increasing temperature and
 increasing concentration of the reactants. The nature of the
 radical and the nature of the molecule also influence the rate
 of reaction, but the effect is more complicated and is not
 easily explained.

REMEMBER THE RAILROAD CONDITION

When crops begin to move this fall the railroad condition will be at its worst.

It is important to get your supplies in early this year.
